ADBIS 2007

# Plan of the presentation

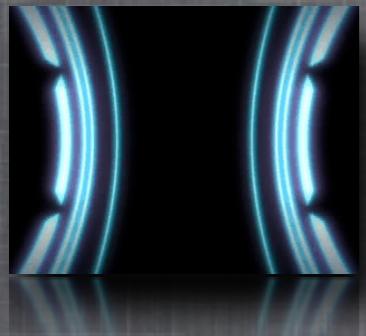

1. Motivations
2. Overview of the ODRA system
3. Detailed discussion of some critical decisions
4. Comparison with major existing solutions

# Motivations

Complexity of current technologies designed for database application developers (eg. Java EE): dozens of frameworks, languages, servers, XML descriptors, code generators etc.

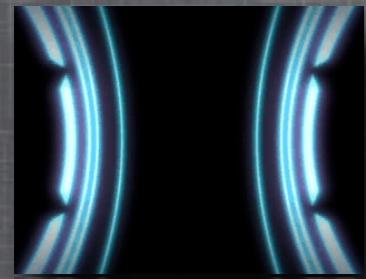

- Low-level programming/object-relational mapping due to impedance mismatch when Java/C#/C++/... is used.
- The need for object-oriented databases is still valid.  
Relational databases: simple data model, poor performance (joins), no support for object-oriented design and analysis (UML).
- The ODMG standard failed, new database architectures (stream, column-based) designed to solve other problems.
- Middleware (eg. CORBA brokers) do not support declarative, bulk data processing.

# ODRA

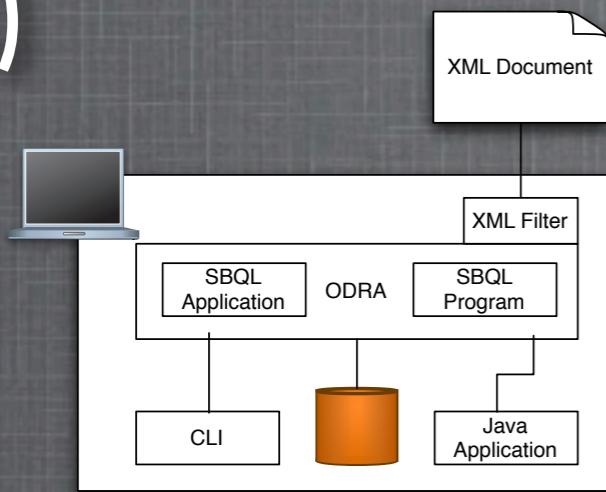

A homogeneous development environment,  
consisting of three, highly integrated elements:

- object-oriented DBMS, completely different from ODMG-like architectures
- object-oriented query/programming language (based on the Stack-Based Approach and SBQL), with queries treated as expressions
- middleware based on updatable views and ideas known from federated databases

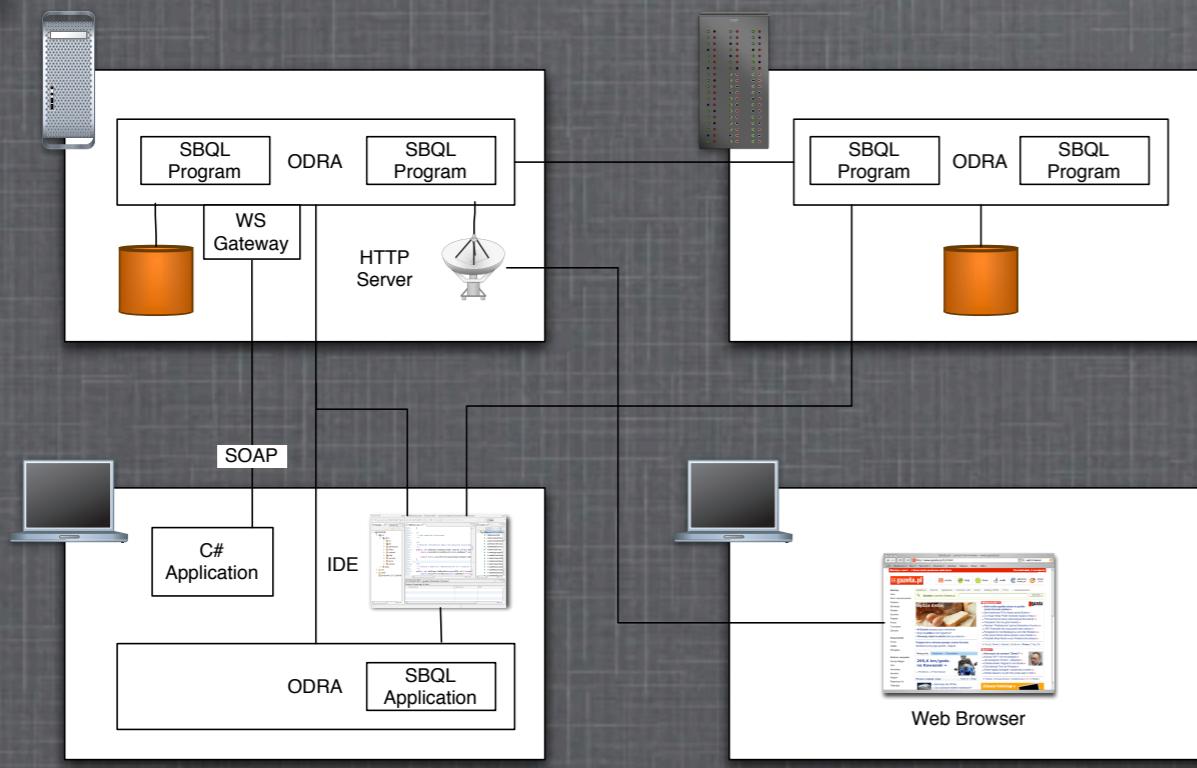

# Scenarios of application

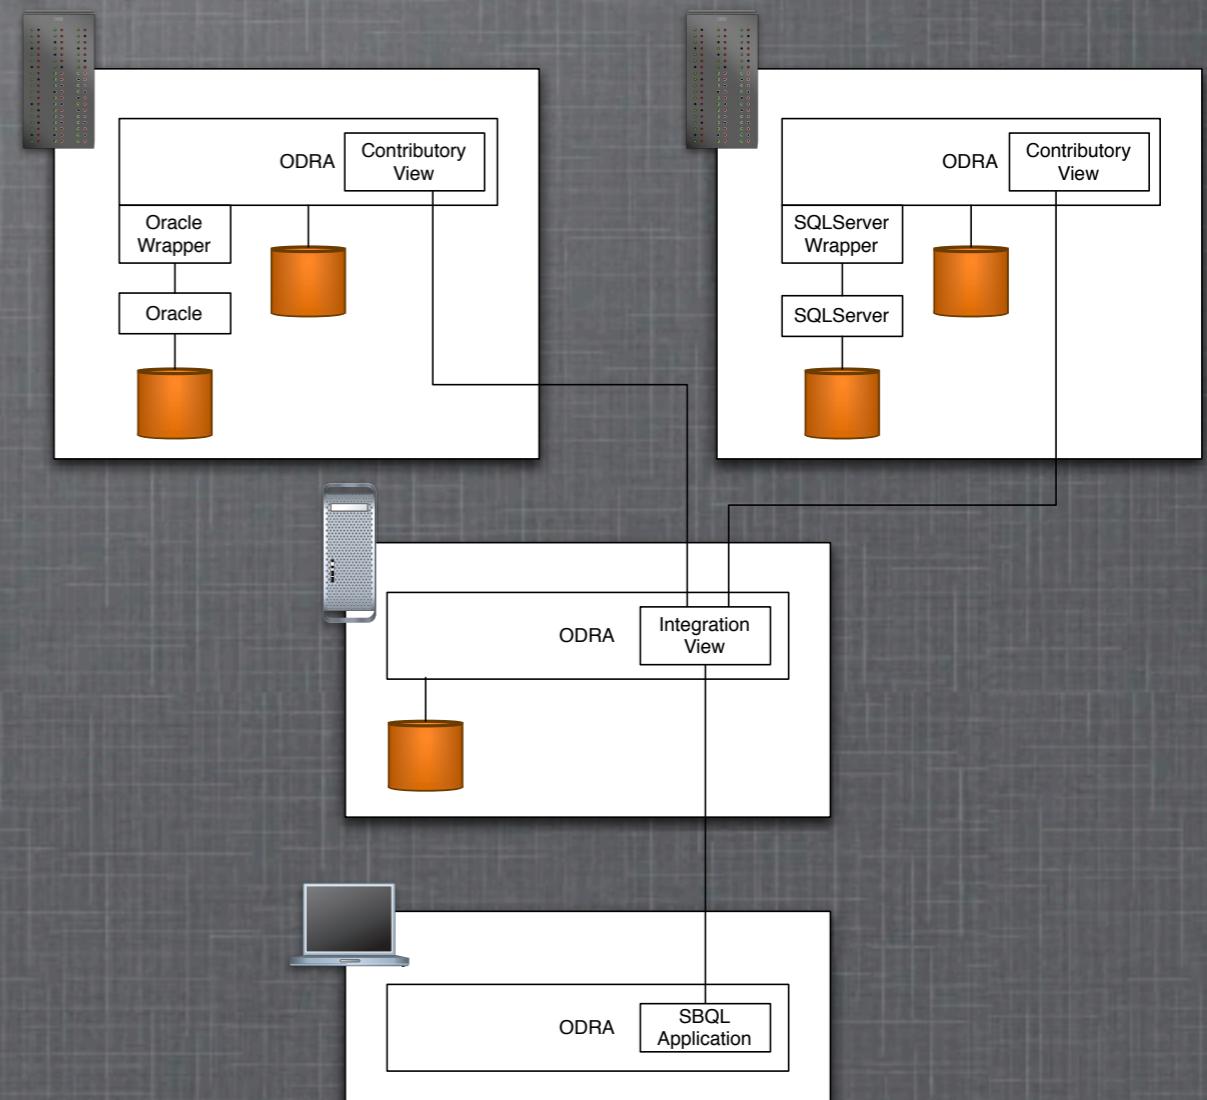

A)

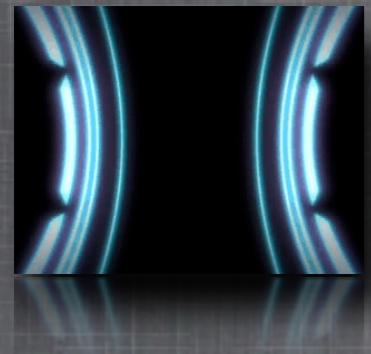

B)

C)

- a) non-distributed application
- b) 3-tier client-server
- c) federated database

# A simple, distributed application

```
module client {
    dblink aps appuser/apppasswd/appuser.appserver@my.appserver.pl;

    main() {
        print aps.count_employees("Smith");
    }
}
```

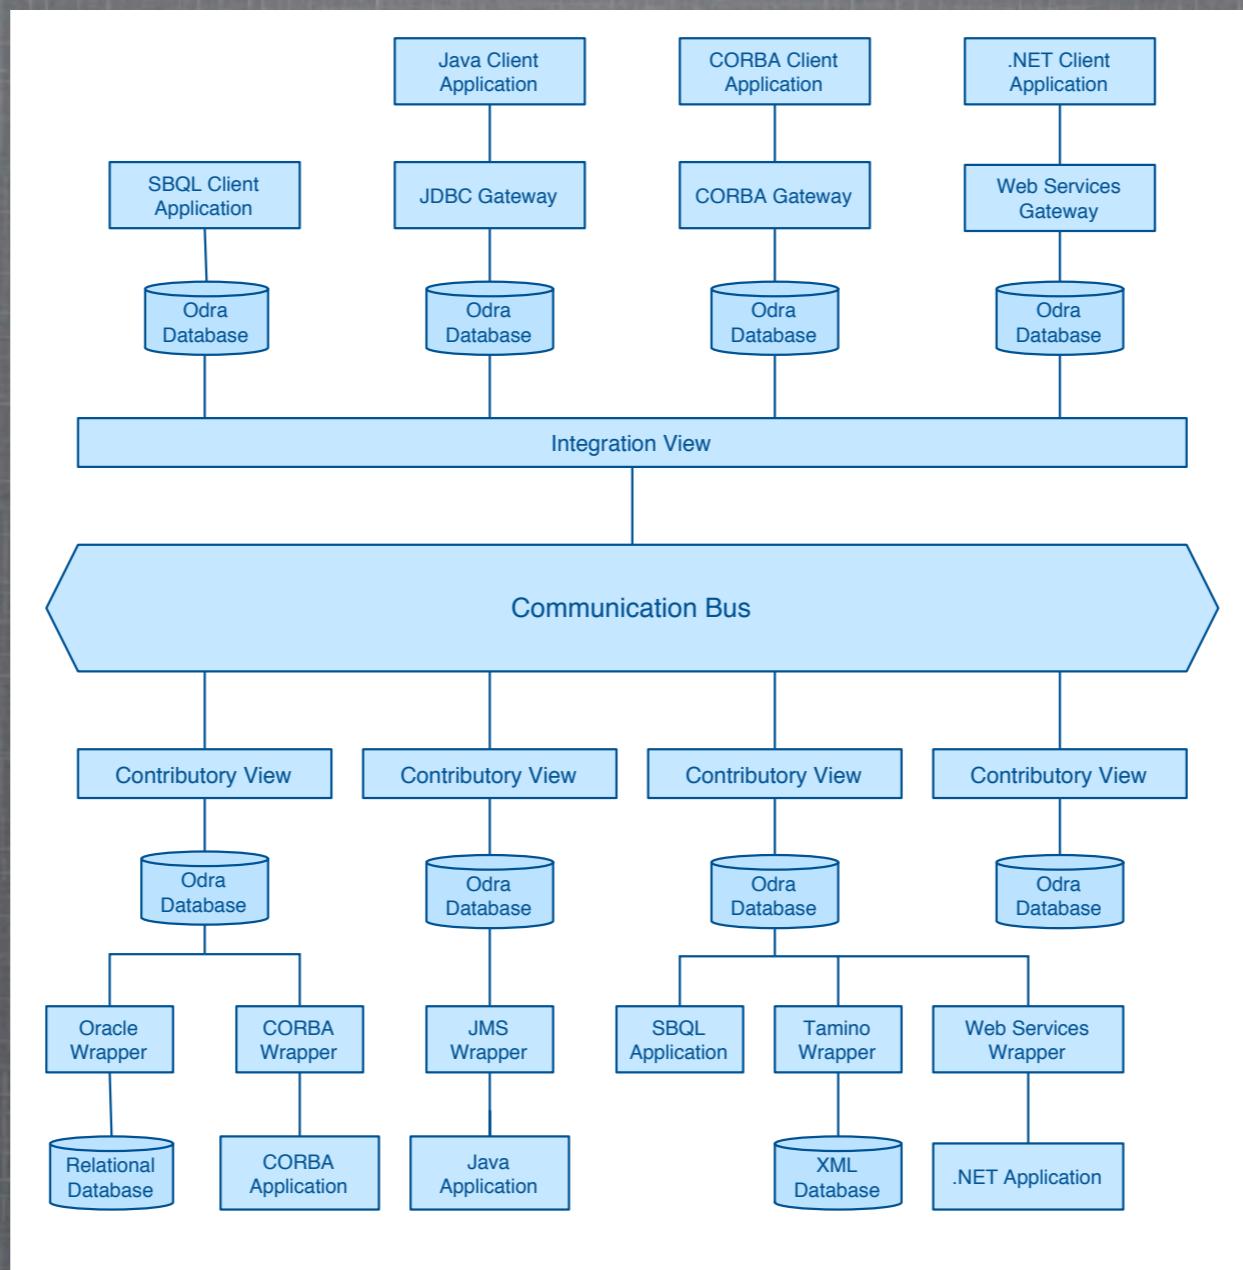

```
module appserver {
    dblink dbs1 dbuser1/apppasswd/dbuser1.dbserver@my.dbserver1.pl;
    dblink dbs2 dbuser2/dbpasswd/dbuser2.dbserver@my.dbserver2.pl;

    count_employees(n : string) : integer {
        return count (dbs1.emp union dbs2.emp) where ename = n;
    }
}
```

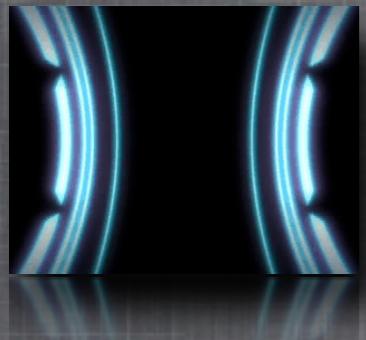

```
module dbserver {
    emp : record { ename : string; salary : integer; job : string; } [0..*]
}
```

# eGovBus architecture

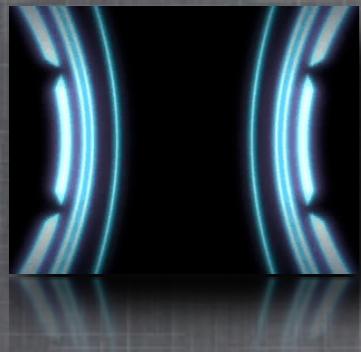

e-Gov Bus - Advanced e-Government Information Service Bus  
(European Commission 6-th Framework Programme, IST-26727)

# SBQL in ODRA

SBQL is a prototype query language that is used to explain the semantics of the Stack Based Approach.

- SBQL in Odra has been extended to a database application programming language
- declarative, high-level, object-oriented programming
- queries as expressions
- typical programming language (modules, procedures, classes, etc.) and database (indexes, triggers, etc.) mechanisms
- semi-strong static type checking
- compile-time (e.g. query rewriting) and runtime (e.g. indexes) optimizers
- updatable views

# Data model

Basic data model ( $M_0$ ) is formed by three kinds of objects:

- simple objects  $\langle \text{OID}, \text{name}, \text{value} \rangle$
- reference objects  $\langle \text{OID}_1, \text{name}, \text{OID}_2 \rangle$
- complex objects  $\langle \text{OID}, \text{name}, \{ \text{object}_1, \text{object}_2, \dots \} \rangle$

emp

ename	sal	job
Smith	2500	Programmer
Jones	3000	Analyst

$\langle i0, \text{root} \rangle$

$\langle i1, \text{emp} \rangle$

$\langle i2, \text{ename}, \text{"Smith"} \rangle$

$\langle i3, \text{sal}, 2500 \rangle$

$\langle i4, \text{job}, \text{"Programmer"} \rangle$

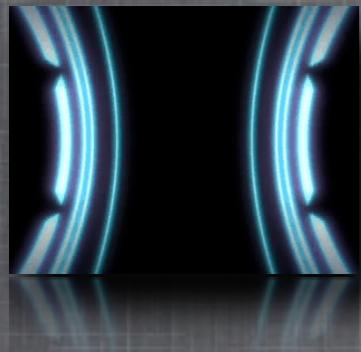

$\langle i5, \text{emp} \rangle$

$\langle i6, \text{ename}, \text{"Smith"} \rangle$

$\langle i7, \text{sal}, 2500 \rangle$

$\langle i8, \text{job}, \text{"Programmer"} \rangle$

Other data models ( $M_1, M_2, \dots$ )  
extend  $M_0$  by more and more  
advanced object-oriented constructs  
(classes, dynamic roles, interfaces, etc.)

# SBQL queries

Basic grammar:

```
query ::=  
    literal  
    | name  
    | unary_op query  
    | query binary_op query
```

List of names and jobs of employees receiving salary = \$2000 and working in departments located in Varna:

(dept where location = "Varna").employs.(emp where salary = 2000).(name, job);

Query results:

1. Simple value (1, true, "cat", etc.)
2. Reference
3. Binder (pair <name, result>)
4. Bag (collection)
5. Sequence (collection)
6. Structure (<single result<sub>1</sub>, single result<sub>2</sub>, ...>)

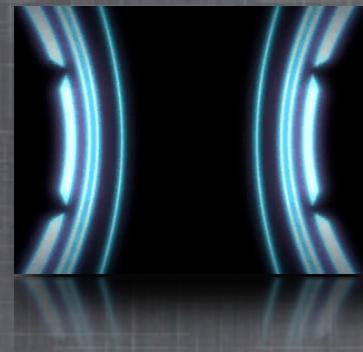

```
bag {  
    struct { name1_OID, job1_OID },  
    struct { name2_OID, job2_OID },  
    ...  
}
```

# Sample query evaluation

Employee where  
 Name = "J. Smith"  
 and salary > 10000

```
<i0, entry,
  <i1, Employee,
    <i4, Name, "J. Smith">
    <i5, Salary, 65000>
  >
  <i2, Employee,
    <i6, Name, "S. Bush">
    <i7, Salary, 45000>
  >
  <i3, Department,
    <i8, Name, "Sales">
    <i9, Location, "London">
  >
  >
```

1. Initialize ENVS and QRES	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	
Employee(i1), Employee(i2), Department(i3)			
2. Execute <b>bind Employee</b>	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	bag(i1, i2)
Employee(i1), Employee(i2), Department(i3)			
3. Pop one element from QRES	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	
Employee(i1), Employee(i2), Department(i3)			
4. Create a new ENVS section. Execute <b>nested i1</b>	<table border="1"><tr><td>Name(i4), Salary(i5)</td></tr></table>	Name(i4), Salary(i5)	
Name(i4), Salary(i5)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	
Employee(i1), Employee(i2), Department(i3)			
5. Execute <b>bind Name</b>	<table border="1"><tr><td>Name(i4), Salary(i5)</td></tr></table>	Name(i4), Salary(i5)	i4
Name(i4), Salary(i5)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	
Employee(i1), Employee(i2), Department(i3)			
6. Push "J. Smith"	<table border="1"><tr><td>Name(i4), Salary(i5)</td></tr></table>	Name(i4), Salary(i5)	"J. Smith"
Name(i4), Salary(i5)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	i4
Employee(i1), Employee(i2), Department(i3)			
7. Pop two elements, dereference i4, compare "J. Smith", and "J. Smith", push true	<table border="1"><tr><td>Name(i4), Salary(i5)</td></tr></table>	Name(i4), Salary(i5)	true
Name(i4), Salary(i5)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	
Employee(i1), Employee(i2), Department(i3)			
8. Execute <b>bind "Salary"</b>	<table border="1"><tr><td>Name(i4), Salary(i5)</td></tr></table>	Name(i4), Salary(i5)	i5
Name(i4), Salary(i5)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	true
Employee(i1), Employee(i2), Department(i3)			
9. Push 10000	<table border="1"><tr><td>Name(i4), Salary(i5)</td></tr></table>	Name(i4), Salary(i5)	10000
Name(i4), Salary(i5)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	i5
Employee(i1), Employee(i2), Department(i3)			
	<table border="1"><tr><td>Name(i4), Salary(i5)</td></tr></table>	Name(i4), Salary(i5)	true
Name(i4), Salary(i5)			
10. Pop two elements, dereference i4, compare "J. Smith", and "J. Smith", push true	<table border="1"><tr><td>Name(i4), Salary(i5)</td></tr></table>	Name(i4), Salary(i5)	true
Name(i4), Salary(i5)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	true
Employee(i1), Employee(i2), Department(i3)			
11. Pop two elements, dereference i4, compare them, push true	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	true
Employee(i1), Employee(i2), Department(i3)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	
Employee(i1), Employee(i2), Department(i3)			
12. Pop one element, since the value is true, add i1 to eres. Remove one section from ENVS.	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	
Employee(i1), Employee(i2), Department(i3)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	i1
Employee(i1), Employee(i2), Department(i3)			
13. Create a new ENVS section. Execute <b>nested i2</b>	<table border="1"><tr><td>Name(i6), Salary(i7)</td></tr></table>	Name(i6), Salary(i7)	
Name(i6), Salary(i7)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	
Employee(i1), Employee(i2), Department(i3)			
14. Execute <b>bind Name</b>	<table border="1"><tr><td>Name(i6), Salary(i7)</td></tr></table>	Name(i6), Salary(i7)	i6
Name(i6), Salary(i7)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	
Employee(i1), Employee(i2), Department(i3)			
15. Push "J. Smith"	<table border="1"><tr><td>Name(i6), Salary(i7)</td></tr></table>	Name(i6), Salary(i7)	"J. Smith"
Name(i6), Salary(i7)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	i6
Employee(i1), Employee(i2), Department(i3)			
16. Pop two elements, dereference i6, compare "S. Bush", and "J. Smith", push false	<table border="1"><tr><td>Name(i6), Salary(i7)</td></tr></table>	Name(i6), Salary(i7)	false
Name(i6), Salary(i7)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	
Employee(i1), Employee(i2), Department(i3)			
17. Execute <b>bind Salary</b>	<table border="1"><tr><td>Name(i6), Salary(i7)</td></tr></table>	Name(i6), Salary(i7)	i7
Name(i6), Salary(i7)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	false
Employee(i1), Employee(i2), Department(i3)			
18. Push 10000	<table border="1"><tr><td>Name(i6), Salary(i7)</td></tr></table>	Name(i6), Salary(i7)	10000
Name(i6), Salary(i7)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	i7
Employee(i1), Employee(i2), Department(i3)			
	<table border="1"><tr><td>Name(i6), Salary(i7)</td></tr></table>	Name(i6), Salary(i7)	false
Name(i6), Salary(i7)			
19. Pop two elements, dereference i7, compare 10000 and 45000, push true	<table border="1"><tr><td>Name(i6), Salary(i7)</td></tr></table>	Name(i6), Salary(i7)	true
Name(i6), Salary(i7)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	false
Employee(i1), Employee(i2), Department(i3)			
20. Pop two elements, compare them, push false	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	false
Employee(i1), Employee(i2), Department(i3)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	
Employee(i1), Employee(i2), Department(i3)			
21. Pop one element, since the value is false, do not add i1 to eres. Remove one section from ENVS.	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	
Employee(i1), Employee(i2), Department(i3)			
22. Push eres onto QRES	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	i1
Employee(i1), Employee(i2), Department(i3)			
	<table border="1"><tr><td>Employee(i1), Employee(i2), Department(i3)</td></tr></table>	Employee(i1), Employee(i2), Department(i3)	
Employee(i1), Employee(i2), Department(i3)			

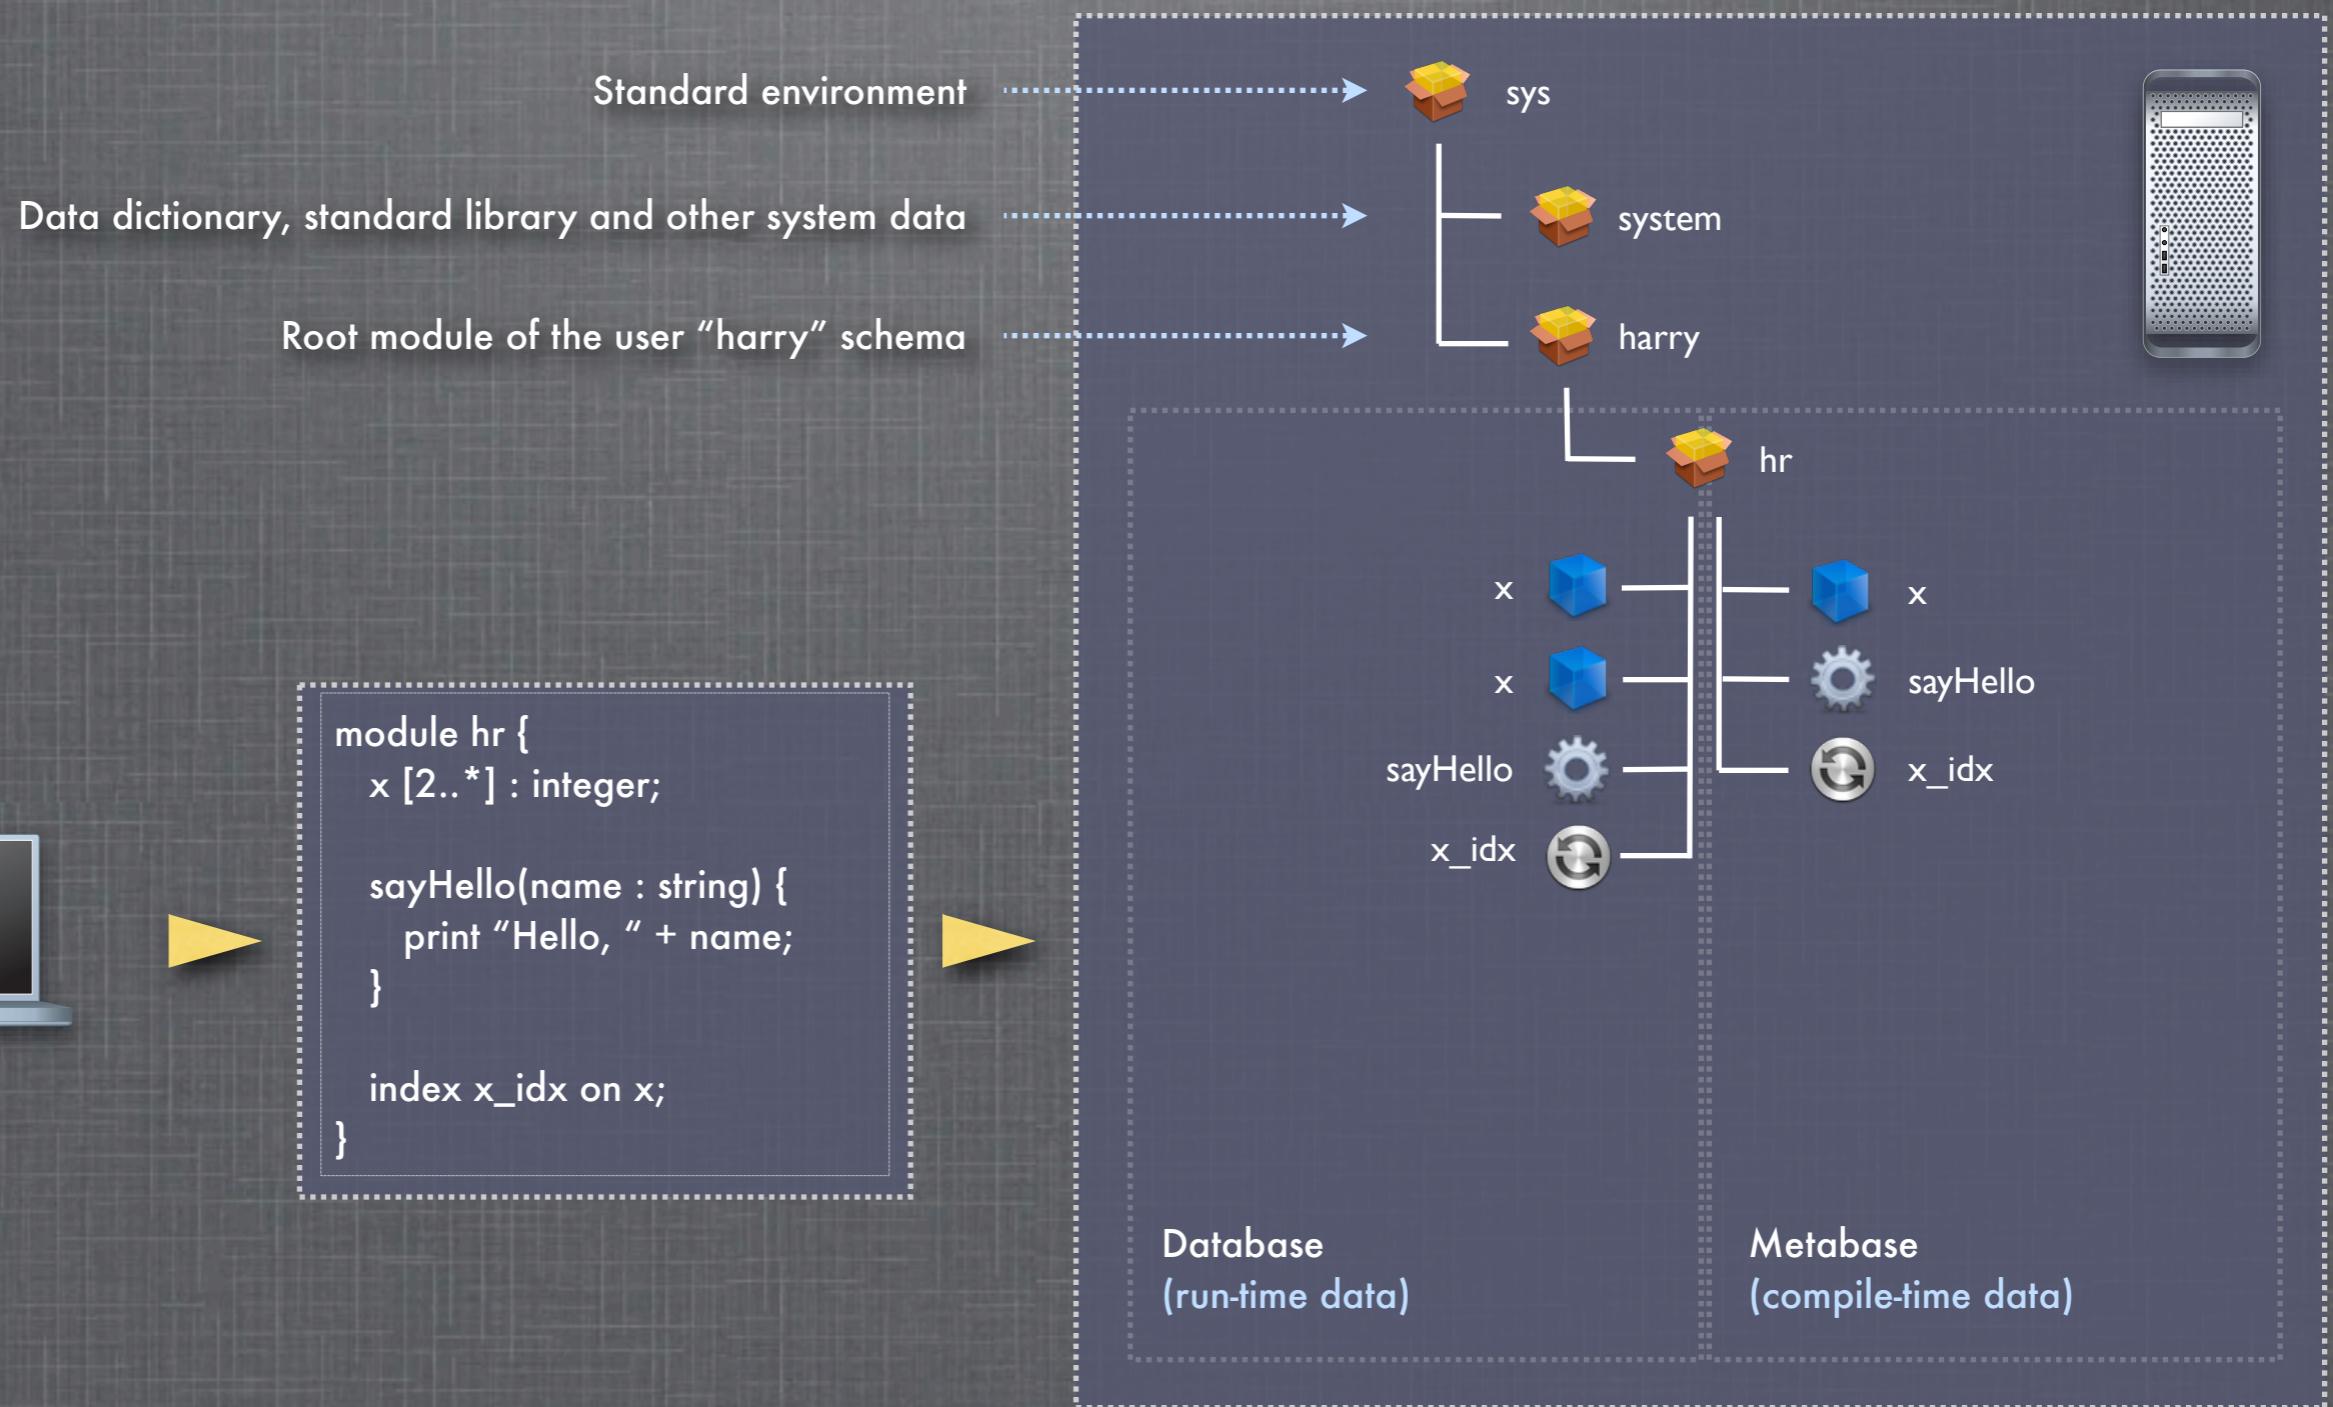

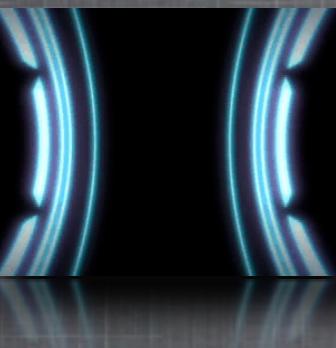

# A sample program

```
module empdept {  
    import another.module;  
  
    type emptype is record {  
        name : string;  
        salary : integer;  
        job : integer;  
        works : ref dept [0..1];  
    }  
  
    type depttype is record {  
        name : string;  
        location : string;  
        employs : ref emp [0..*];  
    }  
  
    emp : emptype [0..*];  
    dept : depttype [0..*];  
  
    count_unemployed_employees() : integer {  
        return count emp where not exists works;  
    }  
  
    find_employees_by_name (n : string) : ref emp [0..*] {  
        return emp where name = n orderby salary;  
    }  
  
    create_employee(ename : string; dn : string) : ref emp {  
        return create emp :=  
            n as name,  
            (dept where name = dn) as works;  
    }  
  
    get_max_int(x : integer [0..*]) : a(b(integer)) {  
        return (max x) as a as b;  
    }  
}
```

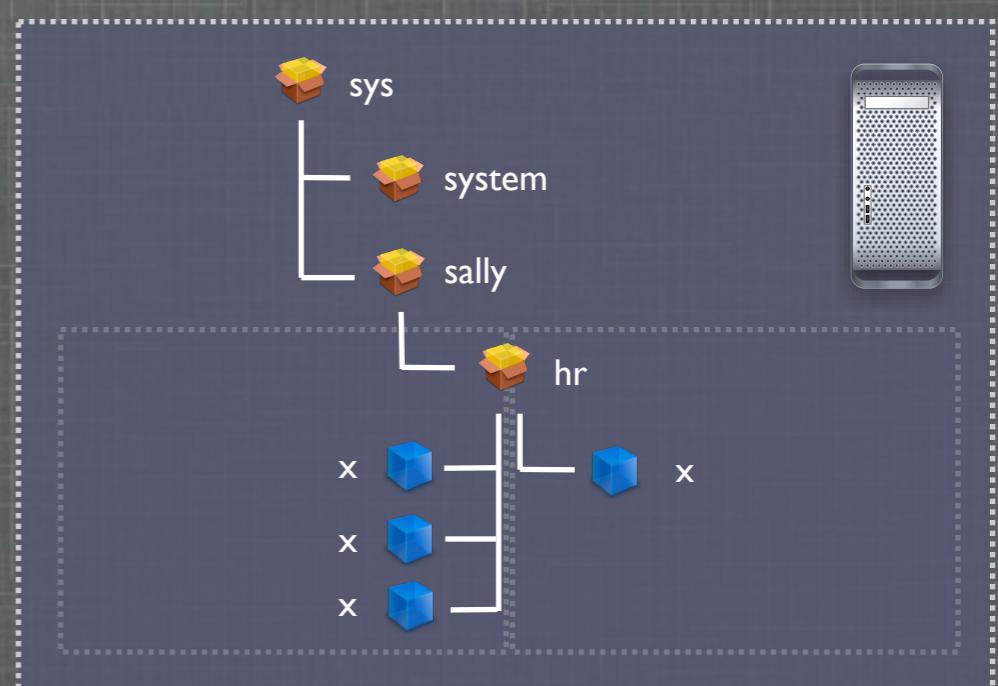

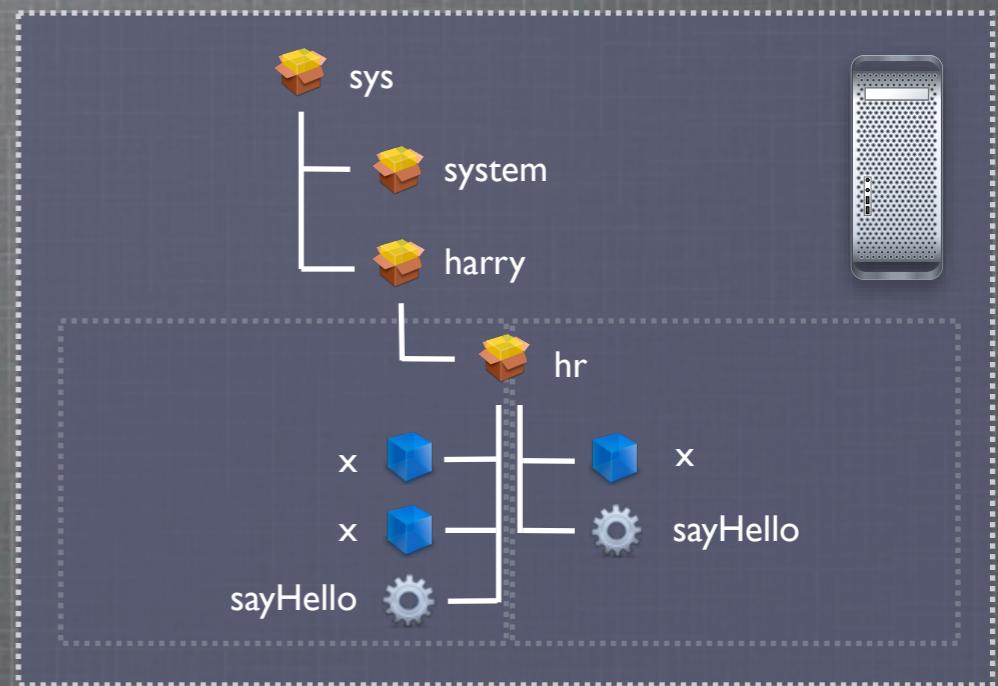

# Database organization

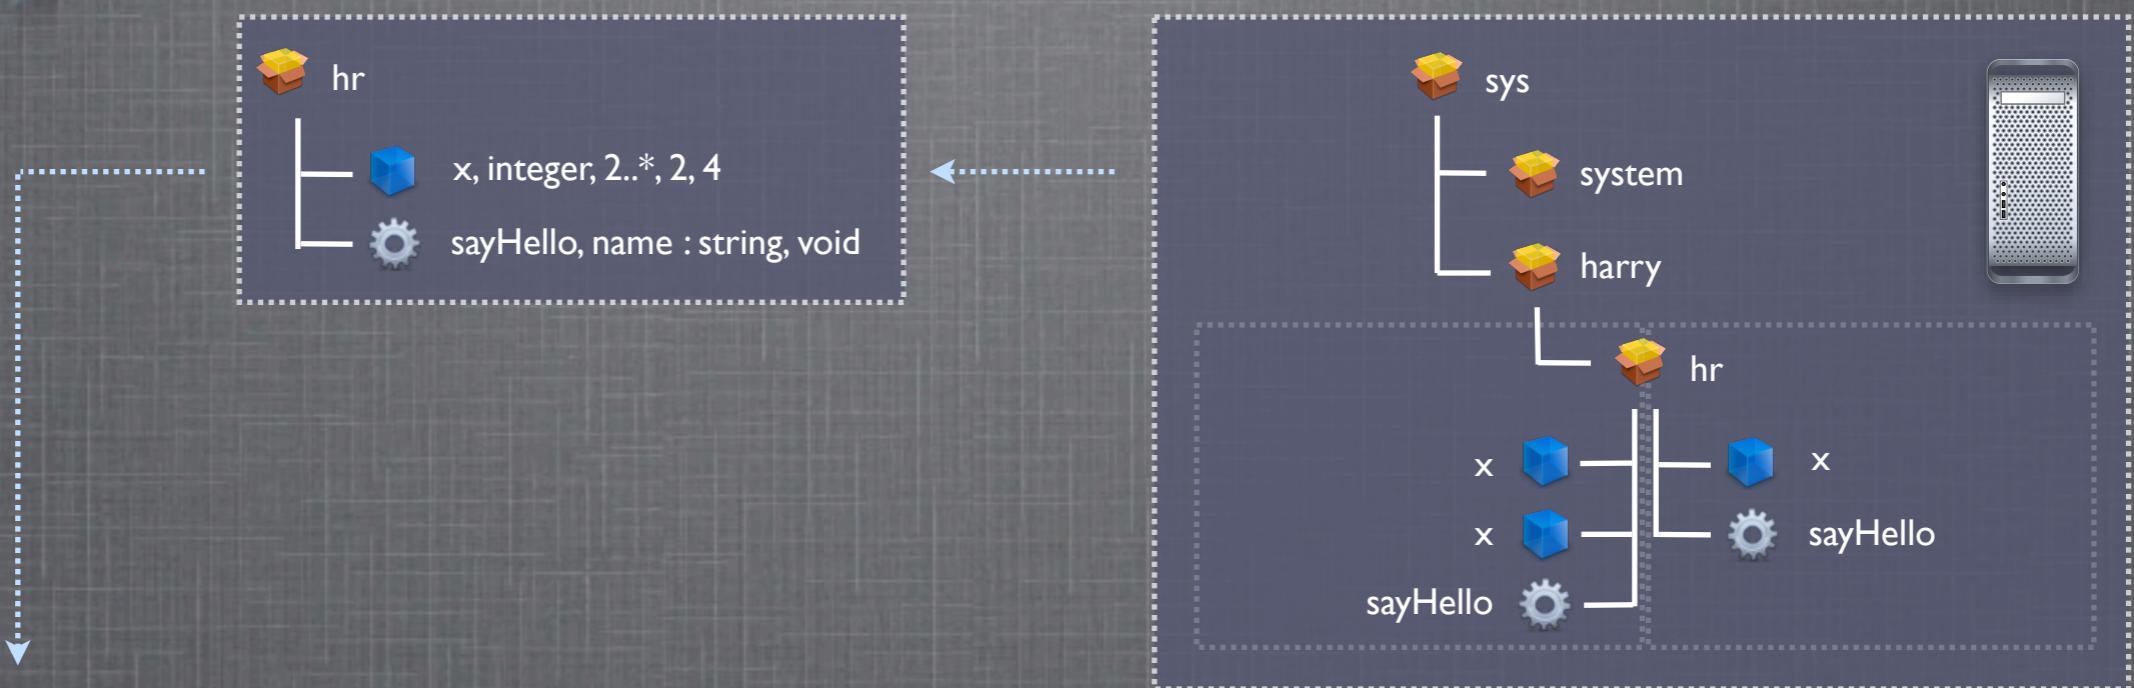

# Distributed communication

```
get_metabase("harry.hr")  
dblink dbs1 dbuser1/dbpasswd/harry.hr@my.dbserver1.pl;

```

# Updatable views in SBQL (1)

- **view structure:**

```
view viewname1 {  
    virtual objects objectname1 { ... } // returns references to virtual objects  
    on delete { ... } // optional (executed when a virtual object is deleted)  
    on update { ... } // optional (executed when a virtual object is updated)  
    on insert { ... } // optional (executed when an object is inserted into a virtual object)  
    on retrieve { ... } // optional (executed when a virtual object is dereferenced)  
  
view viewname2 {  
    virtual objects objectname2 { }  
    on delete { ... }  
    ....  
}  
...
```

- **references to virtual objects:**

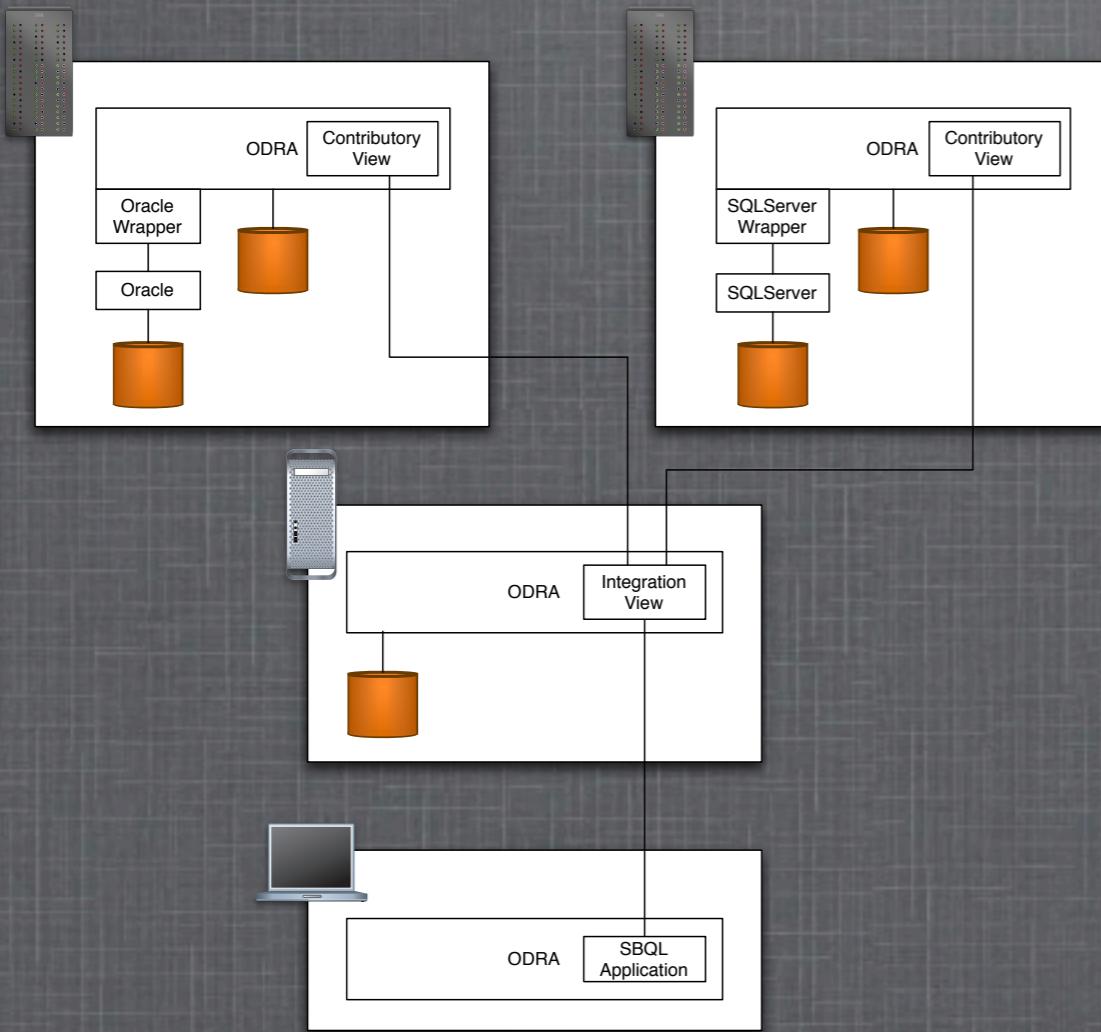

```
<i'm virtual,  
 <view1_OID, seed1>,  
 <view2_OID, seed2>,  
 ...  
>
```

# Updatable views in SBQL (2)

Relational databases:

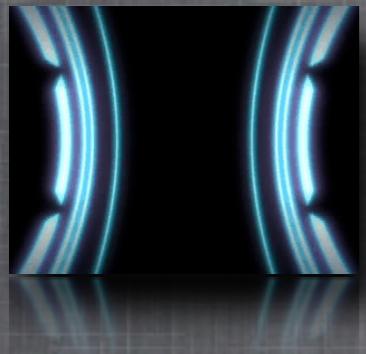

```
CREATE VIEW salview AS  
    select avg(sal) as sal from emp;
```

~~UPDATE salview SET sal = 1000;~~

ODRA:

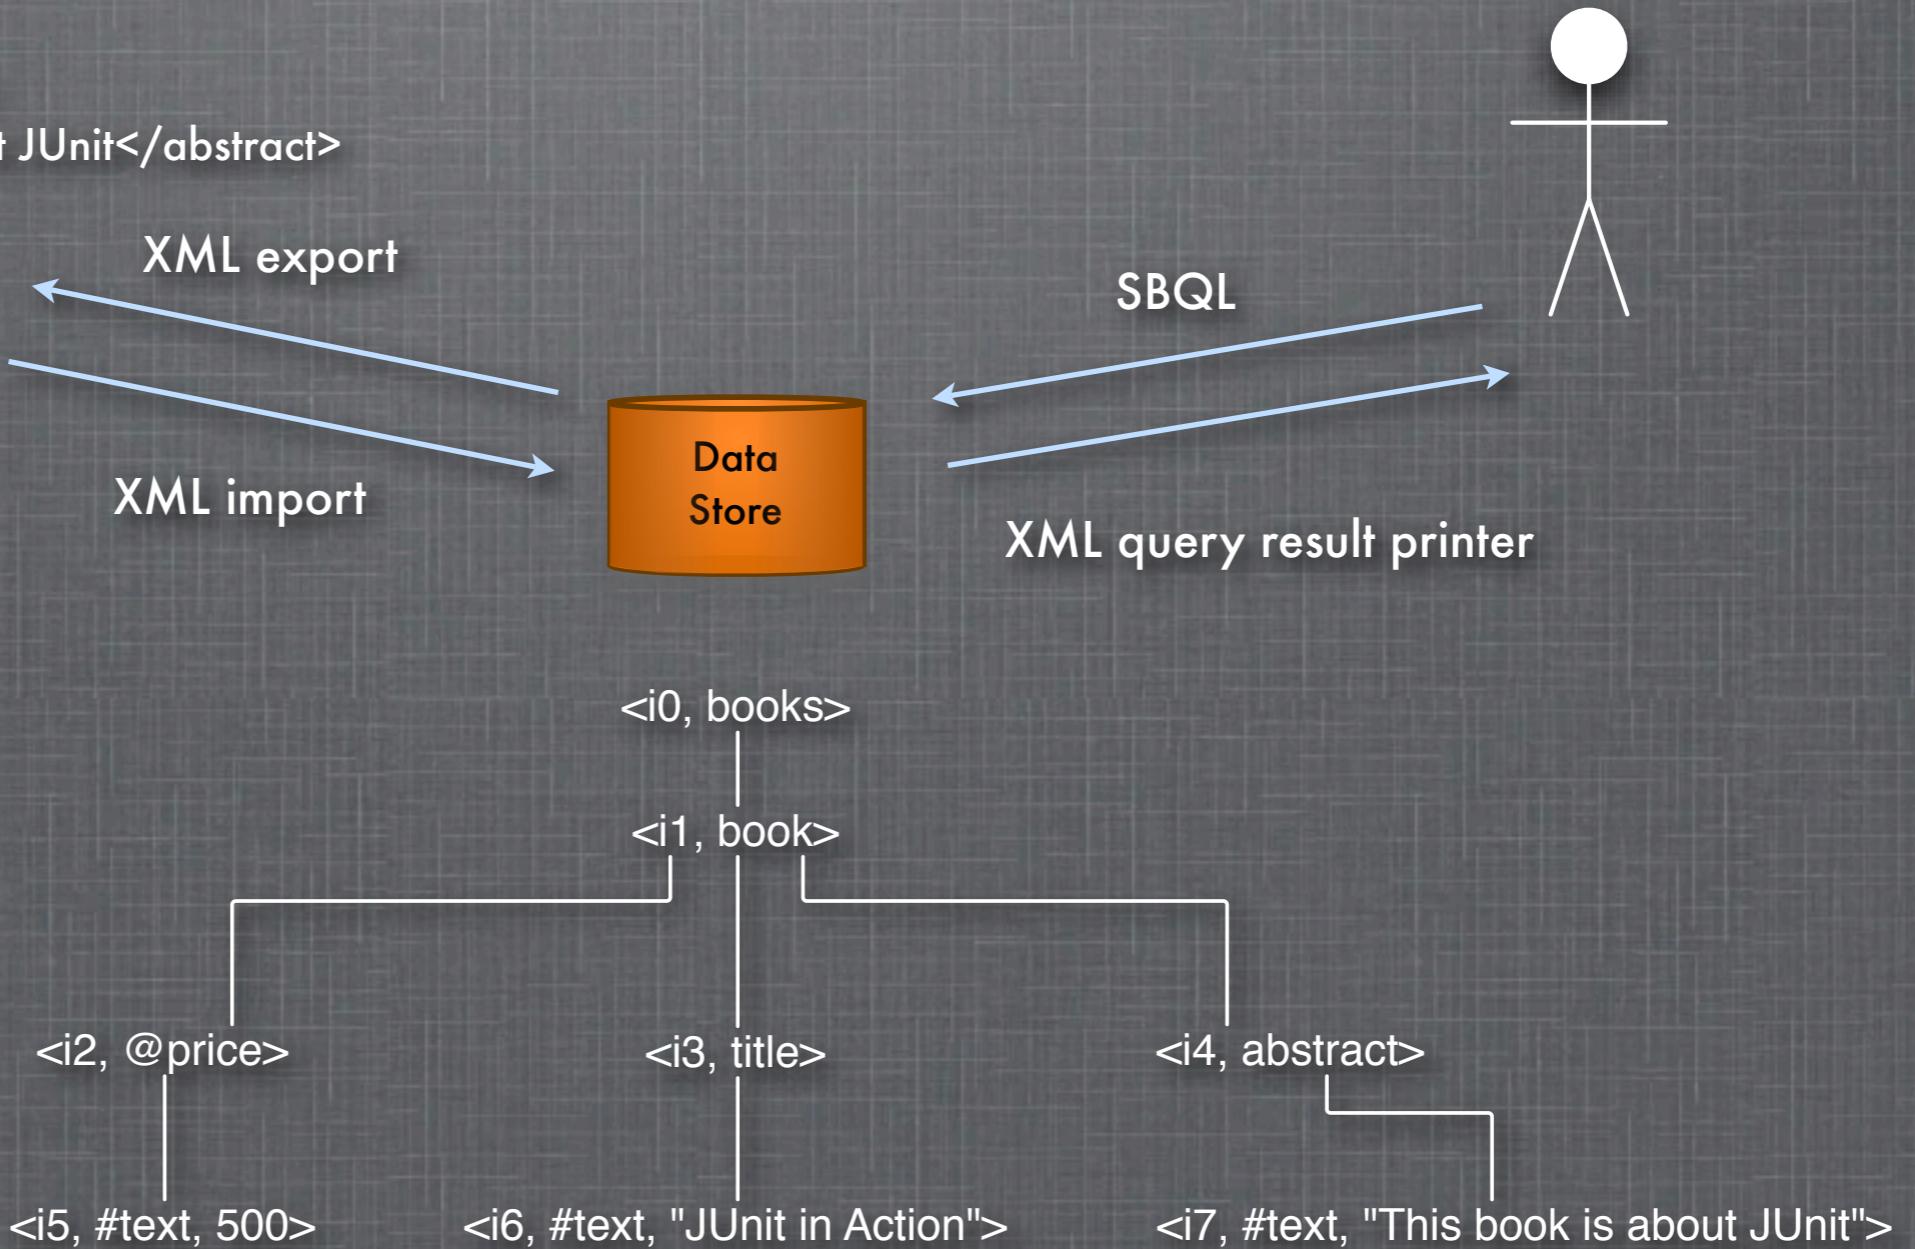

```
view salview {  
    virtual objects sal : x(ref integer) {  
        return avg(emp.sal) as x;  
    }  
  
    on retrieve : integer {  
        return x;  
    }  
  
    on update (n : integer) {  
        for each (emp)  
            sal := (integer) n / count(emp);  
    }  
}  
  
sal + 5;  
  
sal := 1000;
```

# ODRA and XML

GOAL: no XML inside the database

```
<books>
<book price="500">
  <title>JUnit in Action</title>
  <abstract>This book is about JUnit</abstract>
</book>
</books>
```

# SBQL and XML

```
(1 union 2) as x groupas y
```

```
↓  
y(bag { x(1), x(2) })
```

```
↓  
<y>  
<x>1</x>  
<x>2</x>  
</y>
```

```
(books.book where  
@price < 1000).(title, @price)  
as cheapbook groupas books;
```

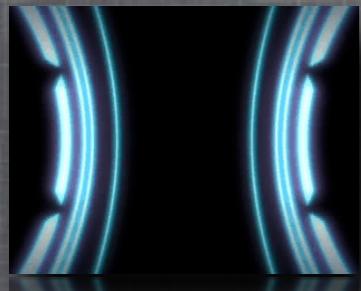

```
↓

</books>
```

```
type bookstype {  
    book : record {  
        @price : string;  
        title : #text(string);  
        abstract : #text(string);  
        author : #text(string)[0..2];  
    } [0..*];  
}  
b : bookstype;
```

```
set_author(b : bookstype) {  
    x : integer := count b.books  
    where not exists author;  
  
    foreach (b.books as x where  
            not exists author)  
        x.(create author("unknown"));  
    return x;  
}  
proc();  
1
```

# ODRA vs. other solutions

- ODRA vs. relational databases: rich, object oriented data model.
- ODRA vs. database application programming languages: no impedance mismatch, queries as expressions, database-like services (eg. persistence).
- ODRA vs. ODMG/JDO/Hibernate/EJB/Cω/Linq: well defined object-oriented query language, no impedance mismatch for queries, fewer problems with optimization, no need for “two worlds of objects”, no code generation, no XML descriptors.
- ODRA vs. db4o (native queries): optimization techniques work on queries, not on low-level byte code.
- ODRA vs. XQuery: independend of XML, syntax much easier to understand, can be used to create client-side application (with GUI), static type checking.
- ODRA vs. CORBA: no code generation, automatic code optimization.

# Thank you!
